
(a) Geometry of ρ-GAM Cone vs. Uniform ℓ_∞ Tube
ρ-GAM Cone ($|f_{\mathbf{w}^*} - f_0| \le \rho(f^* - f_0)$)
Exact Linear Reference $f_{\mathbf{w}^*}(x) = \langle x, \mathbf{w}^* \rangle$
Uniform ℓ_∞ Tube ($\pm\|\boldsymbol{\varepsilon}\|_\infty = \pm 0.63$)
Suboptimal Arms ($i \neq i^*$)
Optimal Arm $\mathbf{x}^*$ ($\varepsilon(\mathbf{x}^*) = 0$)
True Expected Reward $f_0(\mathbf{x}_i)$
Linear Prediction $f_{\mathbf{w}^*}(\mathbf{x}_i) = \langle \mathbf{x}_i, \mathbf{w}^* \rangle$

(b) Mechanism of LinUCB Breakdown (Ghosh et al., Theorem 1)
True Optimal Mean $f_0(\mathbf{x}_k) = 0.935$
Suboptimal Basis Arm 1 Mean $\mu_1 = 0.70$
Biased Linear Extrapolation $\langle \mathbf{x}_k, \boldsymbol{\theta}^* \rangle = 0.485$
LinUCB Index $\mathrm{UCB}_1(t)$ (Basis Arm 1)
LinUCB Index $\mathrm{UCB}_k(t)$ (Optimal Arm k)
LinUCB Ridge Estimate $\langle \mathbf{x}_k, \hat{\boldsymbol{\theta}}_t \rangle$
$\mathrm{UCB}_k(t) < \mu_1$: LinUCB never pulls optimal Arm k again!
